Quantum Science and Technology

Outline (1/2)

1 The General Computational Process

- Classical bits
- Reversible operations on classical bits
- Quantum bits
- Reversible operations on quantum bits
- X-, Y-, Z-, and Hadamard gates

2 Control of the quantum bit

- Driven transmon Hamiltonian
- Two-level approximation
- Schrödinger equation of a drive qubit and its solution in the rotating frame
- Control signals
- Rotating Wave Approximation
- Z-control gate
- X-control gate
- Y-control gate

3 SWAP gate

- SWAP and iSWAP gates definition
- Two coupled transmons: Hamiltonian in the weak-coupling regime
- Two-level approximation
- Circuit Hamiltonian in a two-level approximation
- Schrödinger equation of a drive qubit and its solution in the rotating frame
- Coupled Qubits in the Rotating Wave Approximation
- Coordinates evolution and their matrix representation
- Bell state generation

- A classical computer operates on strings of zeros and ones, such as 110010111011000, converting them into other such strings.
- Each position in such a string is called a bit, and it contains either a 0 or a 1.

- A classical computer operates on strings of zeros and ones, such as 110010111011000, converting them into other such strings.
- Each position in such a string is called a bit, and it contains either a 0 or a 1.
- To represent such collections of bits the computer must contain a corresponding collection of physical systems, each of which can exist in two unambiguously distinguishable physical states, associated with the value (0 or 1) of the abstract bit that the physical system represents.
- Such a physical system could be, for example:
 - a switch that could be open (0) or shut (1)
 - a magnet whose magnetization could be oriented in two different directions, up (0) or down (1)

We represent the state of each classical bit with a box, depicted by the symbol $|\cdot\rangle$, and denoted as **ket**, into which we place the value 0 or 1

$$|0\rangle = \begin{pmatrix} 1\\ 0 \end{pmatrix}; \qquad |1\rangle = \begin{pmatrix} 0\\ 1 \end{pmatrix};$$

We represent the state of each classical bit with a box, depicted by the symbol $|\cdot\rangle$, and denoted as **ket**, into which we place the value 0 or 1

$$|0\rangle = \begin{pmatrix} 1\\ 0 \end{pmatrix}; \qquad |1\rangle = \begin{pmatrix} 0\\ 1 \end{pmatrix};$$

A pair of C-bits may have any of the four possible states

 $|00\rangle$ $|01\rangle$ $|10\rangle$ $|11\rangle$

We represent the state of each classical bit with a box, depicted by the symbol $|\cdot\rangle$, and denoted as **ket**, into which we place the value 0 or 1

$$|0\rangle = \begin{pmatrix} 1\\ 0 \end{pmatrix}; \qquad |1\rangle = \begin{pmatrix} 0\\ 1 \end{pmatrix};$$

 $|00\rangle$ $|01\rangle$ $|10\rangle$ $|11\rangle$

several equivalent notations are currently in use

Forestiere & Miano

Introduction to Circuit Quantum Electrodynamics

$$|x\rangle \otimes |y\rangle = \begin{pmatrix} x_0 \\ x_1 \end{pmatrix} \otimes \begin{pmatrix} y_0 \\ y_1 \end{pmatrix} = \begin{pmatrix} x_0y_0 \\ x_0y_1 \\ x_1y_0 \\ x_1y_1 \end{pmatrix}$$

$$|x\rangle \otimes |y\rangle = \left(\begin{array}{c} x_0 \\ x_1 \end{array}\right) \otimes \left(\begin{array}{c} y_0 \\ y_1 \end{array}\right) = \left(\begin{array}{c} x_0 y_0 \\ x_0 y_1 \\ x_1 y_0 \\ x_1 y_1 \end{array}\right)$$

$$|00\rangle = \begin{pmatrix} 1\\0 \end{pmatrix} \otimes \begin{pmatrix} 1\\0 \end{pmatrix} = \begin{pmatrix} 1\\0\\0\\0 \end{pmatrix};$$

$$|x\rangle \otimes |y\rangle = \begin{pmatrix} x_0 \\ x_1 \end{pmatrix} \otimes \begin{pmatrix} y_0 \\ y_1 \end{pmatrix} = \begin{pmatrix} x_0y_0 \\ x_0y_1 \\ x_1y_0 \\ x_1y_1 \end{pmatrix}$$

$$|00\rangle = \begin{pmatrix} 1\\0 \end{pmatrix} \otimes \begin{pmatrix} 1\\0 \end{pmatrix} = \begin{pmatrix} 1\\0\\0\\0 \end{pmatrix}; \qquad |01\rangle = \begin{pmatrix} 1\\0 \end{pmatrix} \otimes \begin{pmatrix} 0\\1 \end{pmatrix} = \begin{pmatrix} 0\\1\\0\\0 \end{pmatrix};$$

$$|x
angle\otimes|y
angle=\left(egin{array}{c} x_0\ x_1\end{array}
ight)\otimes\left(egin{array}{c} y_0\ y_1\end{array}
ight)=\left(egin{array}{c} x_0y_0\ x_0y_1\ x_1y_0\ x_1y_1\end{array}
ight)$$

$$\begin{aligned} |00\rangle &= \begin{pmatrix} 1\\0 \end{pmatrix} \otimes \begin{pmatrix} 1\\0 \end{pmatrix} = \begin{pmatrix} 1\\0\\0\\0 \end{pmatrix}; \\ |10\rangle &= \begin{pmatrix} 0\\1 \end{pmatrix} \otimes \begin{pmatrix} 1\\0 \end{pmatrix} = \begin{pmatrix} 0\\0\\1\\0 \end{pmatrix}; \end{aligned}$$

$$|01\rangle = \left(\begin{array}{c}1\\0\end{array}
ight)\otimes \left(\begin{array}{c}0\\1\end{array}
ight) = \left(\begin{array}{c}0\\1\\0\\0\end{array}
ight);$$

The state of a pair of classical bits can be expressed as the tensor product of two classical bits

$$|x
angle\otimes|y
angle=\left(egin{array}{c} x_0\ x_1\end{array}
ight)\otimes\left(egin{array}{c} y_0\ y_1\end{array}
ight)=\left(egin{array}{c} x_0y_0\ x_0y_1\ x_1y_0\ x_1y_1\end{array}
ight)$$

$$|00\rangle = \begin{pmatrix} 1\\0 \end{pmatrix} \otimes \begin{pmatrix} 1\\0 \end{pmatrix} = \begin{pmatrix} 1\\0\\0\\0 \end{pmatrix};$$
$$|10\rangle = \begin{pmatrix} 0\\1 \end{pmatrix} \otimes \begin{pmatrix} 1\\0 \end{pmatrix} = \begin{pmatrix} 0\\0\\1\\0 \end{pmatrix};$$

$$|01\rangle = \begin{pmatrix} 1\\0 \end{pmatrix} \otimes \begin{pmatrix} 0\\1 \end{pmatrix} = \begin{pmatrix} 0\\1\\0\\0 \end{pmatrix};$$
$$|11\rangle = \begin{pmatrix} 0\\1 \end{pmatrix} \otimes \begin{pmatrix} 0\\1 \end{pmatrix} = \begin{pmatrix} 0\\0\\0\\1 \end{pmatrix};$$

Introduction to Circuit Quantum Electrodynamics

reversible operations

An operation is **reversible** \Leftrightarrow every final state arises from a unique initial state

reversible operations

An operation is **reversible** \Leftrightarrow every final state arises from a unique initial state

ERASE

$$\mathsf{ERASE}: \begin{cases} |0\rangle \to |0\rangle \\ |1\rangle \to |0\rangle \end{cases}$$

ERASE is **irreversible**: given only the final state, there is no way to recover the initial state.

Identity
$$\mathbf{1} = \begin{cases} |0\rangle \rightarrow |0\rangle \\ |1\rangle \rightarrow |1\rangle \end{cases}$$

- we express the identity operation by a linear operator 1 acting on the two-dimensional vector space
- The action of 1 on the column vectors |0>, |1> is given by a matrix

$$\mathbf{1} = \left(\begin{array}{cc} 1 & 0 \\ 0 & 1 \end{array}\right)$$

Forestiere & Miano

- we express the identity operation by a linear operator 1 acting on the two-dimensional vector space
- The action of 1 on the column vectors |0>, |1> is given by a matrix

$$\mathbf{1} = \left(\begin{array}{cc} 1 & 0\\ 0 & 1 \end{array}\right)$$

NOT (bit flip)

$$\texttt{NOT} = \begin{cases} |0\rangle \rightarrow |1\rangle \\ |1\rangle \rightarrow |0\rangle \end{cases}$$

- The only non-trivial reversible operation we can apply to a single C-bit is the NOT
- NOT is reversible because it has an inverse: applying it a second time brings the state of the C-bit back to its original form.

$$\mathbf{X} = \left(\begin{array}{cc} 0 & 1\\ 1 & 0 \end{array}\right)$$

Forestiere & Miano

Reversible operation on multiple classical bits

A very common 2-Cbit operator is the tensor product \otimes of two 1-Cbit operators

$$\mathbf{A}\otimes\mathbf{B}\ket{xy} = (\mathbf{A}\otimes\mathbf{B})\ket{x}\ket{y} = (\mathbf{A}\ket{x})\otimes(\mathbf{B}\ket{y})$$

Reversible operation on multiple classical bits

A very common 2-Cbit operator is the tensor product \otimes of two 1-Cbit operators

 $\mathbf{A} \otimes \mathbf{B} \ket{xy} = (\mathbf{A} \otimes \mathbf{B}) \ket{x} \ket{y} = (\mathbf{A} \ket{x}) \otimes (\mathbf{B} \ket{y})$

$$\mathbf{A} = \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix}; \quad \mathbf{B} = \begin{pmatrix} b_{11} & b_{12} \\ b_{21} & b_{22} \end{pmatrix}; \\ \mathbf{A} \otimes \mathbf{B} = \begin{pmatrix} a_{11}b_{11} & a_{11}b_{12} & a_{12}b_{11} & a_{12}b_{12} \\ a_{11}b_{21} & a_{11}b_{22} & a_{12}b_{21} & a_{12}b_{22} \\ a_{21}b_{11} & a_{21}b_{12} & a_{22}b_{11} & a_{22}b_{12} \\ a_{21}b_{21} & a_{21}b_{22} & a_{22}b_{21} & a_{22}b_{22} \end{pmatrix}$$

Reversible operation on multiple classical bits

A very common 2-Cbit operator is the tensor product \otimes of two 1-Cbit operators

 $\mathbf{A} \otimes \mathbf{B} \ket{xy} = (\mathbf{A} \otimes \mathbf{B}) \ket{x} \ket{y} = (\mathbf{A} \ket{x}) \otimes (\mathbf{B} \ket{y})$

$$\mathbf{A} = \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix}; \quad \mathbf{B} = \begin{pmatrix} b_{11} & b_{12} \\ b_{21} & b_{22} \end{pmatrix}; \\ \mathbf{A} \otimes \mathbf{B} = \begin{pmatrix} a_{11}b_{11} & a_{11}b_{12} & a_{12}b_{11} & a_{12}b_{12} \\ a_{11}b_{21} & a_{11}b_{22} & a_{12}b_{21} & a_{12}b_{22} \\ a_{21}b_{11} & a_{21}b_{12} & a_{22}b_{11} & a_{22}b_{12} \\ a_{21}b_{21} & a_{21}b_{22} & a_{22}b_{21} & a_{22}b_{22} \end{pmatrix};$$

The matrix representation of the 2-Cbit operator $\mathbf{X} \otimes \mathbf{X}$ in the basis $|0\rangle_2, |1\rangle_2, |2\rangle_2, |3\rangle_2$ is

$$\mathbf{X} = \left(\begin{array}{cc} 0 & 1 \\ 1 & 0 \end{array}\right) \qquad \qquad \mathbf{X} = \left(\begin{array}{cc} 0 & 1 \\ 1 & 0 \end{array}\right)$$

$$\mathbf{X} \otimes \mathbf{X} |xy\rangle = \begin{pmatrix} 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{pmatrix}$$

3-7 Feb 2025

9/80

Swap Operation

One reversible operation we can apply to 2 C-bits is the SWAP operation

 $\mathbf{S}_{10} |xy\rangle \rightarrow |yx\rangle$

$ x\rangle$	y angle	$ \mathbf{S}_{10} xy\rangle$
0	0	00
0	1	10
1	0	01
1	1	11

The matrix representation of the 2-Cbit operator is

$$\mathbf{S}_{10} = \left(\begin{array}{rrrrr} 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{array}\right)$$

$$\mathbf{S}_{10} |00\rangle = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \\ 0 \\ 0 \end{pmatrix} = \underbrace{\begin{pmatrix} 1 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}}_{|00\rangle}; \quad \mathbf{S}_{10} |01\rangle = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 0 \\ 1 \\ 0 \\ 0 \end{pmatrix} = \underbrace{\begin{pmatrix} 0 \\ 0 \\ 1 \\ 0 \\ 0 \\ 1 \\ 0 \end{pmatrix}}_{|10\rangle}$$
$$\mathbf{S}_{10} |10\rangle = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 0 \\ 0 \\ 1 \\ 0 \\ 0 \end{pmatrix} = \underbrace{\begin{pmatrix} 0 \\ 1 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}; \quad \mathbf{S}_{10} |11\rangle = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 0 \\ 0 \\ 0 \\ 1 \\ 0 \\ 1 \end{pmatrix} = \underbrace{\begin{pmatrix} 0 \\ 0 \\ 0 \\ 1 \\ 1 \\ 11\rangle}_{|11\rangle}$$

Controlled C-not

reversible operation we can apply to two Cbits is the controlled-not or cNOT C_{ij}

- State of the first C-bit (the control Cbit) is $|0\rangle$, then C_{10} leaves the state of the second Cbit (the target C-bit) unchanged
- if the state of the control C bit is $|1\rangle$, C₁₀ applies the NOT operator to the state of the target C-bit.
- In either case the state of the control Cbit is left unchanged.

Controlled C-not

reversible operation we can apply to two Cbits is the controlled-not or cNOT C_{ij}

- State of the first C-bit (the control Cbit) is $|0\rangle$, then C_{10} leaves the state of the second Cbit (the target C-bit) unchanged
- if the state of the control C bit is $|1\rangle$, C_{10} applies the NOT operator to the state of the target C-bit.
- In either case the state of the control Cbit is left unchanged.

$$\mathbf{C}_{10} |x\rangle |y\rangle = |x\rangle |y \oplus x\rangle \qquad \qquad |x\rangle - \mathbf{C}_{10} = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 \end{pmatrix}$$

The modulo-2 sum $x \oplus y$ is also called the "exclusive OR" (or XOR)

Forestiere & Miano

Introduction to Circuit Quantum Electrodynamics

Permutations

The most general reversible operation on n C-bits in a classical computer is a permutation of the 2^n different basis states.

If n = 2, there are 4 basis states and 4! possible reversible operation

• The states that a classical bit can have are the two orthonormal vectors $|0\rangle$ and $|1\rangle$.

- The states that a classical bit can have are the two orthonormal vectors $|0\rangle$ and $|1\rangle$.
- The state |ψ⟩ associated with a 1-Qbit can be any unit vector in the 2D vector space spanned by |0⟩ and |1⟩ over the complex numbers.

- The states that a classical bit can have are the two orthonormal vectors $|0\rangle$ and $|1\rangle$.
- The state |ψ⟩ associated with a 1-Qbit can be any unit vector in the 2D vector space spanned by |0⟩ and |1⟩ over the complex numbers.

$$|\psi\rangle = \alpha_0 |0\rangle + \alpha_1 |1\rangle$$
 with $|\alpha_0|^2 + |\alpha_1|^2 = 1$

- The states that a classical bit can have are the two orthonormal vectors $|0\rangle$ and $|1\rangle$.
- The state |ψ⟩ associated with a 1-Qbit can be any unit vector in the 2D vector space spanned by |0⟩ and |1⟩ over the complex numbers.

$$|\psi\rangle = \alpha_0 |0\rangle + \alpha_1 |1\rangle$$
 with $|\alpha_0|^2 + |\alpha_1|^2 = 1$

$$|\psi\rangle = \alpha_0 \left(\begin{array}{c} 1\\ 0 \end{array}\right) + \alpha_1 \left(\begin{array}{c} 0\\ 1 \end{array}\right) = \left(\begin{array}{c} \alpha_0\\ \alpha_1 \end{array}\right)$$

The state $|\psi\rangle$ is said to be a superposition of the states $|0\rangle$ and $|1\rangle$ with amplitudes α_0 and α_1 .

$$|\psi
angle = \cos{ heta\over2}|0
angle + e^{iarphi}\sin{ heta\over2}|1
angle$$

 $0<\theta<\pi;\; 0<\varphi<2\pi$

Figure: Bloch Sphere

The state Ψ associated with a 2-qbits quantum register is a normalized superposition of the four classical basis states

$$\Psi = \alpha_{00} |00\rangle + \alpha_{01} |01\rangle + \alpha_{10} |10\rangle + \alpha_{11} |11\rangle$$

with the normalization condition $|\alpha_{01}|^2 + |\alpha_{01}|^2 + |\alpha_{01}|^2 + |\alpha_{01}|^2 = 1$

The state Ψ associated with a 2-qbits quantum register is a normalized **superposition** of the four classical basis states

$$\Psi = \alpha_{00} |00\rangle + \alpha_{01} |01\rangle + \alpha_{10} |10\rangle + \alpha_{11} |11\rangle$$

with the normalization condition $|\alpha_{01}|^2 + |\alpha_{01}|^2 + |\alpha_{01}|^2 + |\alpha_{01}|^2 = 1$

$$\Psi = \alpha_{00} \begin{pmatrix} 1\\0\\0\\0 \end{pmatrix} + \alpha_{01} \begin{pmatrix} 0\\1\\0\\0 \end{pmatrix} + \alpha_{10} \begin{pmatrix} 0\\0\\1\\0 \end{pmatrix} + \alpha_{11} \begin{pmatrix} 0\\0\\0\\1 \end{pmatrix} = \begin{pmatrix} \alpha_{00}\\\alpha_{01}\\\alpha_{10}\\\alpha_{11} \end{pmatrix}$$

Product States vs Entangled States

A particular 2-Qbit state Ψ is generated by the tensor product of two 1-Qbit states φ and ψ

$$\Psi = \ket{\varphi} \otimes \ket{\psi} = (a_0 \ket{0} + a_1 \ket{1}) \otimes (b_0 \ket{0} + b_1 \ket{1}) = \left(egin{array}{c} a_0 \\ a_1 \end{array}
ight) \otimes \left(egin{array}{c} b_0 \\ b_1 \end{array}
ight) = \left(egin{array}{c} a_0 b_0 \\ a_1 b_0 \\ a_1 b_1 \end{array}
ight)$$

Product States vs Entangled States

A particular 2-Qbit state Ψ is generated by the tensor product of two 1-Qbit states φ and ψ

$$\Psi = \ket{arphi} \otimes \ket{\psi} = (a_0 \ket{0} + a_1 \ket{1}) \otimes (b_0 \ket{0} + b_1 \ket{1}) = \left(egin{array}{c} a_0 \ a_1 \end{array}
ight) \otimes \left(egin{array}{c} b_0 \ b_1 \end{array}
ight) = \left(egin{array}{c} a_0 b_0 \ a_0 b_1 \ a_1 b_0 \ a_1 b_1 \end{array}
ight)$$

- A general two Qbit state is in the special form above if and only if $\alpha_{00}\alpha_{11} = \alpha_{10}\alpha_{10}$
- This state is denoted as **product state**

Product States vs Entangled States

A particular 2-Qbit state Ψ is generated by the tensor product of two 1-Qbit states φ and ψ

$$\Psi = \ket{arphi} \otimes \ket{\psi} = (a_0 \ket{0} + a_1 \ket{1}) \otimes (b_0 \ket{0} + b_1 \ket{1}) = \left(egin{array}{c} a_0 \ a_1 \end{array}
ight) \otimes \left(egin{array}{c} b_0 \ b_1 \end{array}
ight) = \left(egin{array}{c} a_0 b_0 \ a_1 b_0 \ a_1 b_0 \ a_1 b_1 \end{array}
ight)$$

- A general two Qbit state is in the special form above if and only if $\alpha_{00}\alpha_{11} = \alpha_{10}\alpha_{10}$
- This state is denoted as **product state**

Nonproduct states of two or more Qbits are called **entangled** states
Product States vs Entangled States

A particular 2-Qbit state Ψ is generated by the tensor product of two 1-Qbit states φ and ψ

$$\Psi = \ket{arphi} \otimes \ket{\psi} = (a_0 \ket{0} + a_1 \ket{1}) \otimes (b_0 \ket{0} + b_1 \ket{1}) = \left(egin{array}{c} a_0 \ a_1 \end{array}
ight) \otimes \left(egin{array}{c} b_0 \ b_1 \end{array}
ight) = \left(egin{array}{c} a_0 b_0 \ a_1 b_1 \ a_1 b_0 \ a_1 b_1 \end{array}
ight)$$

- A general two Qbit state is in the special form above if and only if $\alpha_{00}\alpha_{11} = \alpha_{10}\alpha_{10}$
- This state is denoted as **product state**

Nonproduct states of two or more Qbits are called entangled states

Bell States

$$\Phi^{\pm} = \frac{|00\rangle \pm |11\rangle}{\sqrt{2}} \qquad \Psi^{\pm} = \frac{|01\rangle \pm |01\rangle}{\sqrt{2}}$$

Introduction to Circuit Quantum Electrodynamics

This generalizes to n Qbits, whose state is a superposition of the 2^n different classical states,

$$|\Psi\rangle = \sum_{0 \le x < 2^n} \alpha_x |x\rangle_n$$

with amplitudes whose squared magnitudes sum to unity $\sum_{0 \le x < 2^n} |\alpha_x|^2 = 1$

Unitary transformation

• The only nontrivial reversible operation a classical computer can perform on a single C-bit is the NOT operation $\mathbb X$

Unitary operators
$$\mathbf{U}\mathbf{U}^{\dagger}=\mathbf{U}^{\dagger}\mathbf{U}=\mathbf{1}$$

- The only nontrivial reversible operation a classical computer can perform on a single C-bit is the NOT operation $\mathbb X$
- The most general reversible operations that a quantum computer can perform upon a single Q-bit are represented by the action on the state of the Qbit of any linear transformation that takes unit vectors into unit vectors

Unitary operators
$$\mathbf{U}\mathbf{U}^{\dagger}=\mathbf{U}^{\dagger}\mathbf{U}=\mathbf{1}$$

- The only nontrivial reversible operation a classical computer can perform on a single C-bit is the NOT operation $\mathbb X$
- The most general reversible operations that a quantum computer can perform upon a single Q-bit are represented by the action on the state of the Qbit of any linear transformation that takes unit vectors into unit vectors

Unitary operators
$$\mathbf{U}\mathbf{U}^{\dagger}=\mathbf{U}^{\dagger}\mathbf{U}=\mathbf{1}$$

- U is a **unitary** transformation, represented by a unitary matrix
- Since any unitary transformation has a unitary inverse, such actions of a quantum computer on a Qbit are reversible

The action of a sequence of gates acting on n Qbits may be represented by block diagrams:

- Initially, the Qbit is described by the input state $|\Psi\rangle$.
- The thin line (wire) guides us through the subsequent history of the Qbit.

The action of a sequence of gates acting on n Qbits may be represented by block diagrams:

- Initially, the Qbit is described by the input state $|\Psi\rangle$.
- The thin line (wire) guides us through the subsequent history of the Qbit.
- After emerging from the box representing U, the Qbit is described by the final state U |Ψ>.

- Initially, the Qbits are described by the input state on the left.
- They are acted upon first by the gate V and then by the gate U

$$|\Psi
angle$$
 — V — U — UV $|\Psi
angle$

• they emerging on the right in the final state $\mathbf{UV}|\Psi\rangle$.

The order in which the Qbits encounter unitary gates in the figure is opposite to the order in which the corresponding symbols are written in the symbol for the final state on the right.

X-gate (qubit flip)

$$|\Psi\rangle$$
 — **X** — $|\chi\rangle$

$$\mathbf{X} = \sigma_x : \begin{cases} |0\rangle \to |1\rangle \\ |1\rangle \to |0\rangle \end{cases}$$

Representation of the X-gate in the basis
$$\{|0\rangle$$

$$\mathbf{X} = \sigma_x = \left(\begin{array}{cc} 0 & 1 \\ 1 & 0 \end{array}\right)$$

X-gate (qubit flip)

$$|\Psi\rangle$$
 — **X** — $|\chi\rangle$

$$\mathbf{X} = \sigma_x : \begin{cases} |0\rangle \to |1\rangle \\ |1\rangle \to |0\rangle \end{cases} \qquad \mathbf{X} = \sigma_x = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}$$

In a Bloch sphere representation, the X-gate performs a rotation of π around the *x*-axis

3-7 Feb 2025

X_{Θ} -gate (arbitrary rotation around the x-axis)

• In the Bloch sphere representation, the X_{Θ} -gate performs a rotation of Θ around the x-axis

X_{Θ} -gate (arbitrary rotation around the x-axis)

$$|\Psi\rangle - \mathbf{X}_{\Theta} - |\chi\rangle \qquad \mathbf{X}_{\Theta} = \begin{vmatrix} -i\cos\left(\frac{\Theta_x}{2}\right) & \sin\left(\frac{\Theta_x}{2}\right) \\ \sin\left(\frac{\Theta_x}{2}\right) & -i\cos\left(\frac{\Theta_x}{2}\right) \end{vmatrix}$$

- In the Bloch sphere representation, the X_{Θ} -gate performs a rotation of Θ around the x-axis
- For example, if $\Theta_x = \pi/2$ we have:

$$\mathbf{X}_{\frac{\pi}{2}} = \frac{1}{\sqrt{2}} \begin{vmatrix} -i & 1\\ 1 & -i \end{vmatrix}$$

Introduction to Circuit Quantum Electrodynamics

Y-gate

$$|\Psi\rangle$$
 — **Y** — $|\chi\rangle$

Matrix representation of the **Y**-gate in the basis $\{|0\rangle, |1\rangle\}$

$$\mathbf{Y} = \sigma_y : \begin{cases} |0\rangle \to i |1\rangle \\ |1\rangle \to -i |0\rangle \end{cases}$$

$$\mathbf{Y} = \sigma_y = \left(\begin{array}{cc} 0 & -i\\ i & 0 \end{array}\right)$$

Y-gate

$$|\Psi\rangle$$
 — **Y** — $|\chi\rangle$

Matrix representation of the Y-gate in the basis $\{|0\rangle, |1\rangle\}$

$$\mathbf{Y} = \sigma_y : \begin{cases} |0\rangle \to i \, |1\rangle \\ |1\rangle \to -i \, |0\rangle \end{cases}$$

$$\mathbf{Y} = \sigma_y = \left(\begin{array}{cc} 0 & -i\\ i & 0 \end{array}\right)$$

In a Bloch sphere representation, the **Y**-gate performs a rotation of π around the *y*-axis

Y_{Θ} -gate (arbitrary rotation around the x-axis)

Representation of the \mathbf{Y}_{Θ} -gate in the basis $\{|0\rangle, |1\rangle\}$

$$|\Psi\rangle - \boxed{\mathbf{Y}_{\Theta}} |\chi\rangle \qquad \qquad \mathbf{Y}_{\Theta} = \begin{vmatrix} -i\cos\left(\frac{\Theta_y}{2}\right) & \sin\left(\frac{\Theta_y}{2}\right) \\ \sin\left(\frac{\Theta_y}{2}\right) & -i\cos\left(\frac{\Theta_y}{2}\right) \end{vmatrix}$$

• In the Bloch sphere representation, the \mathbf{Y}_{Θ} -gate performs a rotation of Θ_y around the y-axis

Y_{Θ} -gate (arbitrary rotation around the x-axis)

Representation of the \mathbf{Y}_{Θ} -gate in the basis $\{|0\rangle, |1\rangle\}$

$$|\Psi\rangle - \boxed{\mathbf{Y}_{\Theta}} |\chi\rangle \qquad \qquad \mathbf{Y}_{\Theta} = \begin{vmatrix} -i\cos\left(\frac{\Theta_y}{2}\right) & \sin\left(\frac{\Theta_y}{2}\right) \\ \sin\left(\frac{\Theta_y}{2}\right) & -i\cos\left(\frac{\Theta_y}{2}\right) \end{vmatrix}$$

- In the Bloch sphere representation, the \mathbf{Y}_{Θ} -gate performs a rotation of Θ_y around the y-axis
- For example, if $\Theta_y = \pi/2$ we have:

$$\mathbf{Y}_{\frac{\pi}{2}} = \frac{1}{\sqrt{2}} \begin{vmatrix} -i & 1\\ 1 & -i \end{vmatrix}$$

Z-gate

$$|\Psi\rangle$$
 — **Z** — $|\chi\rangle$

Matrix representation of the **Z**-gate in the basis $\{|0\rangle, |1\rangle\}$

 $\mathbf{Z}:egin{cases} |0
angle
ightarrow -|0
angle \ |1
angle
ightarrow +|1
angle \end{cases}$

$$\mathbf{Z} = \left(\begin{array}{cc} -1 & 0 \\ 0 & +1 \end{array} \right)$$

Z-gate

$$|\Psi\rangle$$
 — **Z** — $|\chi\rangle$

Matrix representation of the Z-gate in the basis $\{|0\rangle, |1\rangle\}$

 $\mathbf{Z}:egin{cases} |0
angle
ightarrow -|0
angle \ |1
angle
ightarrow +|1
angle \end{cases}$

$$\mathbf{Z} = \left(\begin{array}{cc} -1 & 0\\ 0 & +1 \end{array}\right)$$

In a Bloch sphere representation, the **Z**-gate performs a rotation of π around the *z*-axis

Representation of the \mathbb{Z}_{Θ} -gate in the basis $\{|0\rangle, |1\rangle\}$

$$|\Psi\rangle - \boxed{\mathbf{Z}_{\Theta}} |\chi\rangle \qquad \qquad \mathbf{Z}_{\Theta} = \begin{vmatrix} -1 & 0 \\ 0 & -e^{-i\Theta} \end{vmatrix}$$

• In a Bloch sphere representation, the Z-gate performs a rotation of π around the x-axis

$$\mathbf{Z}_{\frac{\pi}{2}} = \left| \begin{array}{cc} -1 & 0 \\ 0 & i \end{array} \right|$$

Introduction to Circuit Quantum Electrodynamics

The order in which we apply the gates is very important (non-commutative)

 $[\mathbf{X},\mathbf{Z}]\neq 0$

$$|\psi\rangle$$
 — **X** – **Z** – **ZX** $|\psi\rangle$ $|\psi\rangle$ — **Z** – **X** – **XZ** $|\psi\rangle$

 ${\bf X}$ anticommutes with ${\bf Z}$

$$\mathbf{Z}\mathbf{X} = -\mathbf{X}\mathbf{Z}$$

$$|\psi\rangle - \mathbf{H} - \mathbf{H} |\psi\rangle$$
$$\mathbf{H} = \frac{\mathbf{X} - \mathbf{Z}}{\sqrt{2}} = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 & 1 \\ 1 & -1 \end{pmatrix}$$
$$\mathbf{H} |0\rangle = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 & 1 \\ 1 & -1 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 \\ 1 \end{pmatrix} = \frac{1}{\sqrt{2}} (|0\rangle + |1\rangle)$$
$$\mathbf{H} |1\rangle = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 & 1 \\ 1 & -1 \end{pmatrix} \begin{pmatrix} 0 \\ 1 \end{pmatrix} = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 \\ -1 \end{pmatrix} = \frac{1}{\sqrt{2}} (|0\rangle - |1\rangle)$$

- One degree of freedom: flux $\hat{\phi}$;
- \hat{q} is the conjugate variable to ϕ
- $\Phi_0 = 2\pi \frac{\hbar}{2e}$ is the flux quantum

•
$$E_C = \frac{(2e)^2}{2C}$$

• E_J is the Josephson Energy

- One degree of freedom: flux $\hat{\phi}$;

Qubit control & Logic Gates

The state of the circuit at time t is approx. described by the ket $|\psi(t)\rangle$ in a 2D Hilbert space

 $|\psi(t)\rangle = c_0(t) |0\rangle + c_1(t) |1\rangle$

- $|c_0(t)|^2$ yields the probability that the outcome of the measurement of energy of the qubit at time t is $-E_0$
- $|c_1(t)|^2$ yields the probability that at time t the outcome of the measurement of energy of the qubit at time t is $+E_0$

$$|\psi(0)\rangle = c_0(0) |0\rangle + c_1(0) |1\rangle$$

Qubit control & Logic Gates

The state of the circuit at time t is approx. described by the ket $|\psi(t)\rangle$ in a 2D Hilbert space

 $\left|\psi(t)\right\rangle = c_0(t)\left|0\right\rangle + c_1(t)\left|1\right\rangle$

- $|c_0(t)|^2$ yields the probability that the outcome of the measurement of energy of the qubit at time t is $-E_0$
- |c₁(t)|² yields the probability that at time t the outcome of the measurement of energy of the qubit at time t is +E₀
- At t = 0 the state of the quantum circuit is $|\psi(0)\rangle = |\psi_0\rangle$

 $|\psi(0)\rangle = c_0(0) |0\rangle + c_1(0) |1\rangle$

The state of the circuit at time t is approx. described by the ket $|\psi(t)\rangle$ in a 2D Hilbert space

 $|\psi(t)\rangle = c_0(t) |0\rangle + c_1(t) |1\rangle$

• To find the state of the quantum circuit $|\psi(t)\rangle$ at time t, we have to solve the Schrödinger equation

$$i\hbar \frac{d|\psi(t)\rangle}{dt} = \left[\hbar \frac{\omega_t}{2} \hat{\sigma}_z - \hbar \Omega f(t) \hat{\sigma}_x\right] |\psi(t)\rangle$$
$$|\psi(t_0)\rangle = |\psi_0\rangle$$

Variable transformation: rotating frame

$$i\frac{d|\psi(t)\rangle}{dt} = \left[\frac{\omega_t}{2}\hat{\sigma}_z - \Omega f(t)\hat{\sigma}_x\right]|\psi(t)\rangle$$

• We solve the problem in a new variable $|\psi'\rangle$.

Variable transformation: rotating frame

$$i\frac{d|\psi(t)\rangle}{dt} = \left[\frac{\omega_t}{2}\hat{\sigma}_z - \Omega f(t)\hat{\sigma}_x\right]|\psi(t)\rangle$$

- We solve the problem in a new variable $|\psi'\rangle$.
- At time t, the Bloch sphere representation of $|\psi'\rangle$ is rotated clockwise about the z-axis by an angle $\alpha(t) = +\omega_d t$ with respect to the Bloch sphere representation of $|\psi\rangle$

$$i\frac{d|\psi(t)\rangle}{dt} = \left[\frac{\omega_t}{2}\hat{\sigma}_z - \Omega f(t)\hat{\sigma}_x\right]|\psi(t)\rangle$$

- We solve the problem in a new variable $|\psi'\rangle$.
- At time t, the Bloch sphere representation of $|\psi'\rangle$ is rotated clockwise about the z-axis by an angle $\alpha(t) = +\omega_d t$ with respect to the Bloch sphere representation of $|\psi\rangle$

•
$$\widehat{R}_z(\alpha(t)) = -e^{i\alpha/2} \mathbf{Z}_\alpha$$

$$|\psi(t)\rangle = \widehat{R}_z(\alpha(t)) |\psi'(t)\rangle$$
 where $\widehat{R}_z(\alpha(t)) = \exp\left(-i\alpha(t)\frac{\widehat{\sigma}_z}{2}\right)$ $\alpha(t) = -\omega_d t$

$$i \frac{d|\psi(t)
angle}{dt} = \left[\frac{\omega_t}{2}\hat{\sigma}_z - \Omega f(t)\hat{\sigma}_x
ight]|\psi(t)
angle$$

- We solve the problem in a new variable $|\psi'\rangle$.
- At time t, the Bloch sphere representation of $|\psi'\rangle$ is rotated clockwise about the z-axis by an angle $\alpha(t) = +\omega_d t$ with respect to the Bloch sphere representation of $|\psi\rangle$

$$i \frac{d|\psi(t)
angle}{dt} = \left[\frac{\omega_t}{2}\hat{\sigma}_z - \Omega f(t)\hat{\sigma}_x
ight]|\psi(t)
angle$$

- We solve the problem in a new variable $|\psi'\rangle$.
- At time t, the Bloch sphere representation of |ψ'⟩ is rotated clockwise about the z-axis by an angle α(t) = +ω_dt with respect to the Bloch sphere representation of |ψ⟩

$$i\frac{d\left|\psi'\right\rangle}{dt} = \left[\frac{\Delta\omega}{2}\hat{\sigma}'_{z} - \Omega f(t)\hat{\sigma}'_{x}\right]\left|\psi'\right\rangle$$

We have to find the expression of the operators $\hat{\sigma}'_z \, \hat{\sigma}'_x$ in the rotating frame.

$$irac{d\left|\psi'
ight
angle}{dt}=\left[rac{\Delta\omega}{2}\hat{\sigma}_{m{z}}'-\Omega f(t)\hat{\sigma}_{m{x}}'
ight]\left|\psi'
ight
angle$$

$$\begin{cases} \hat{\sigma}_z' = \hat{R}_z^\dagger \hat{\sigma}_z \hat{R}_z \\ \hat{\sigma}_x' = \hat{R}_z^\dagger \hat{\sigma}_x \hat{R}_z \end{cases}$$

$$\begin{cases} \hat{\sigma}'_z = \hat{R}_z^{\dagger} \hat{\sigma}_z \hat{R}_z = \hat{\sigma}_z \\ \hat{\sigma}'_x(t) = \hat{R}_z^{\dagger} \hat{\sigma}_x \hat{R}_z = \hat{\sigma}_x \cos\left(\omega_d t\right) + \hat{\sigma}_y \sin\left(\omega_d t\right) \end{cases}$$

$$irac{d\left|\psi'
ight
angle}{dt}=\left[rac{\Delta\omega}{2}\hat{\sigma}_{z}'-\Omega f(t)\hat{\sigma}_{x}'
ight]\left|\psi'
ight
angle$$

$$\begin{cases} \hat{\sigma}_z' = \hat{R}_z^\dagger \hat{\sigma}_z \hat{R}_z \\ \hat{\sigma}_x' = \hat{R}_z^\dagger \hat{\sigma}_x \hat{R}_z \end{cases}$$

$$\begin{cases} \hat{\sigma}'_z = \hat{R}_z^{\dagger} \hat{\sigma}_z \hat{R}_z = \hat{\sigma}_z \\ \hat{\sigma}'_x(t) = \hat{R}_z^{\dagger} \hat{\sigma}_x \hat{R}_z = \hat{\sigma}_x \cos\left(\omega_d t\right) + \hat{\sigma}_y \sin\left(\omega_d t\right) \end{cases}$$

Schrödinger equation in the rotating frame

$$i\frac{d\left|\psi'\right\rangle}{dt} = \left[\frac{\Delta\omega}{2}\hat{\sigma}_{z} - \Omega f(t)(\hat{\sigma}_{x}\cos\left(\omega_{d}t\right) + \hat{\sigma}_{y}\sin\left(\omega_{d}t\right))\right]\left|\psi'\right\rangle$$

$$i\frac{d\left|\psi'\right\rangle}{dt} = \left[\frac{\Delta\omega}{2}\hat{\sigma}_{z} + \Omega f(t)(\hat{\sigma}_{x}\cos\left(\omega_{d}t\right) - \hat{\sigma}_{y}\sin\left(\omega_{d}t\right))\right]\left|\psi'\right\rangle$$

$$f(t) = s(t)\sin(\omega_d t + \gamma) = s(t) \left[\underbrace{\cos(\gamma)}_{I}\sin(\omega_d t) + \underbrace{\sin(\gamma)}_{Q}\cos(\omega_d t)\right]$$

- s(t) is the envelope function
- $I = \cos \gamma$ is the in-phase component; $Q = \sin \gamma$ is the out-of-phase component

$$i\frac{d\left|\psi'\right\rangle}{dt} = \left[\frac{\Delta\omega}{2}\hat{\sigma}_{z} + \Omega s(t)\left[I\sin(\omega_{d}t) + Q\cos(\omega_{d}t)\right](\hat{\sigma}_{x}\cos\left(\omega_{d}t\right) - \hat{\sigma}_{y}\sin\left(\omega_{d}t\right))\right]\left|\psi'\right\rangle$$

• Local Oscillator (LO). This generates a high-frequency carrier signal at frequency ω_{LO}. It acts as the reference signal for the mixing.

- Local Oscillator (LO). This generates a high-frequency carrier signal at frequency ω_{LO} . It acts as the reference signal for the mixing.
- Arbitrary Waveform Generator (AWG). This produces baseband signals (I and Q components) that represent the desired control pulses. These are lower-frequency signals typically shaped for specific qubit operations (e.g., Gaussian or shaped pulses).

- Local Oscillator (LO). This generates a high-frequency carrier signal at frequency ω_{LO} . It acts as the reference signal for the mixing.
- Arbitrary Waveform Generator (AWG). This produces baseband signals (I and Q components) that represent the desired control pulses. These are lower-frequency signals typically shaped for specific qubit operations (e.g., Gaussian or shaped pulses).
- **Baseband Pulses (I and Q)**: These are the output signals from the AWG. The I (In-phase) and Q (Quadrature) components define the amplitude and phase of the control pulses.

- Local Oscillator (LO). This generates a high-frequency carrier signal at frequency ω_{LO} . It acts as the reference signal for the mixing.
- Arbitrary Waveform Generator (AWG). This produces baseband signals (I and Q components) that represent the desired control pulses. These are lower-frequency signals typically shaped for specific qubit operations (e.g., Gaussian or shaped pulses).
- **Baseband Pulses (I and Q)**: These are the output signals from the AWG. The I (In-phase) and Q (Quadrature) components define the amplitude and phase of the control pulses.
- IQ Mixer. Combines the carrier signal from the LO with the baseband signals I and Q. This produces a modulated signal, $V_d(t)$, with a frequency $\omega_d = \omega_{\text{LO}} \pm \omega_{\text{AWG}}$. This mixing process shifts the baseband signal to the desired frequency range for driving the qubit.

Schrödinger equation in the rotating frame

$$i\frac{d\left|\psi'\right\rangle}{dt} = \left[\frac{\Delta\omega}{2}\hat{\sigma}_{z} - \Omega s(t)\left[I\sin(\omega_{d}t) + Q\cos(\omega_{d}t)\right]\left(\hat{\sigma}_{x}\cos\left(\omega_{d}t\right) - \hat{\sigma}_{y}\sin\left(\omega_{d}t\right)\right)\right]\left|\psi'\right\rangle$$

Introduction to Circuit Quantum Electrodynamics

Schrödinger equation in the rotating frame

$$i\hbar \frac{d \left|\psi'\right\rangle}{dt} = \left[i\hbar \frac{\Delta\omega}{2} \hat{\sigma}_{z} \underbrace{-i\hbar\Omega \frac{s(t)}{2} \left[I\hat{\sigma}_{y} + Q\hat{\sigma}_{x}\right]}_{H_{drive}^{\mathbb{RWA}}} \underbrace{-i\hbar\Omega \frac{s(t)}{2} \left[\hat{A}\sin\left(2\omega_{d}t\right) + \hat{B}\cos\left(2\omega_{d}t\right)\right]}_{H_{drive}^{(2\omega_{d})}}\right] \left|\psi'\right\rangle$$

$$\begin{cases} H_{drive}^{(\mathbb{RWA})} = -\hbar\Omega \frac{s(t)}{2} \left[I\hat{\sigma}_{y} + Q\hat{\sigma}_{x}\right] \\ H_{drive}^{(2\omega_{d})} = -\hbar\Omega \frac{s(t)}{2} \left\{\hat{A}\sin\left(2\omega_{d}t\right) + \hat{B}\cos\left(2\omega_{d}t\right)\right\} \end{cases}$$

$$i\hbar\frac{d\left|\psi'\right\rangle}{dt} = \left[\hbar\frac{\Delta\omega}{2}\hat{\sigma}_{z} + H_{drive}^{(\mathrm{RWA})} + H_{drive}^{(2\omega_{d})}\right]\left|\psi'\right\rangle$$

Forestiere & Miano

Introduction to Circuit Quantum Electrodynamics

$$i\hbar\frac{d\left|\psi'\right\rangle}{dt} = \left[\hbar\frac{\Delta\omega}{2}\hat{\sigma}_{z} + H_{drive}^{(\mathrm{RWA})} + H_{drive}^{(2\omega_{d})}\right]\left|\psi'\right\rangle \approx \left[\hbar\frac{\Delta\omega}{2}\hat{\sigma}_{z} + H_{drive}^{(\mathrm{RWA})}\right]\left|\psi'\right\rangle$$

- When $\Omega \ll \omega_d$, the rapidly oscillating terms in the driving Hamiltonian, denoted as $\hat{H}_{drive}^{(2\omega_d)}$, oscillate at frequency $2\omega_d$ and can be neglected.
- These terms average out to zero over time, as their contribution is negligible on the longer time scales dictated by $\Delta \omega(t)$ and s(t).
- This simplification is known as the Rotating Wave Approximation (RWA), which retains only the terms responsible for the dominant system dynamics.

$$\begin{cases} i\frac{d\left|\psi'\right\rangle}{dt} = \left[\frac{\Delta\omega(t)}{2}\hat{\sigma}_{z} - s(t)\frac{\Omega}{2}\left(Q\hat{\sigma}_{x} + I\hat{\sigma}_{y}\right)\right]\left|\psi'\right\rangle\\ \left|\psi'\left(0\right)\right\rangle = \left|\psi_{0}\right\rangle \end{cases}$$

$$\begin{cases} i\frac{d\left|\psi'\right\rangle}{dt} = \left[\frac{\Delta\omega(t)}{2}\hat{\sigma}_{z} - s(t)\frac{\Omega}{2}\left(Q\hat{\sigma}_{x} + I\hat{\sigma}_{y}\right)\right]\left|\psi'\right\rangle\\ \left|\psi'\left(0\right)\right\rangle = \left|\psi_{0}\right\rangle \end{cases}$$

• We switch-off the driving, setting s(t) = 0

$$\begin{cases} i\frac{d\left|\psi'\right\rangle}{dt} = \frac{\Delta\omega(t)}{2}\hat{\sigma}_{z}\left|\psi'\right\rangle & \text{with} \quad \Delta\omega(t) = \omega_{t}(t) - \omega_{d}\\ \left|\psi'\left(0\right)\right\rangle = \left|\psi_{0}\right\rangle \end{cases}$$

$$\begin{cases} i\frac{d\left|\psi'\right\rangle}{dt} = \left[\frac{\Delta\omega(t)}{2}\hat{\sigma}_{z} - s(t)\frac{\Omega}{2}\left(Q\hat{\sigma}_{x} + I\hat{\sigma}_{y}\right)\right]\left|\psi'\right\rangle\\ \left|\psi'\left(0\right)\right\rangle = \left|\psi_{0}\right\rangle \end{cases}$$

• We switch-off the driving, setting s(t) = 0

$$\begin{cases} i\frac{d\left|\psi'\right\rangle}{dt} = \frac{\Delta\omega(t)}{2}\hat{\sigma}_{z}\left|\psi'\right\rangle & \text{with} \quad \Delta\omega(t) = \omega_{t}(t) - \omega_{d}\\ \left|\psi'\left(0\right)\right\rangle = \left|\psi_{0}\right\rangle \end{cases}$$

• After integration, we arrive at the following solution:

$$\left|\psi'(t)\right\rangle = \exp\left[-i\frac{\Theta_z(t)t}{2}\hat{\sigma}_z\right]\left|\psi_0\right\rangle \qquad \text{with} \quad \Theta_z(t) = \int_0^t \Delta\omega(\tau)d\tau$$

$$|\psi'(t)
angle = \exp\left[-i\frac{\Theta_z(t)t}{2}\hat{\sigma}_z\right]|\psi_0
angle \qquad \text{with} \quad \Theta_z(t) = \int_0^t \Delta\omega(\tau)d\tau$$

The initial state is

$$|\psi_{0}\rangle = c_{0}(t_{0})|0\rangle + c_{1}(t_{0})|1\rangle$$

Thus by exploiting the definition of the $\hat{\sigma}_z$ operator $[\hat{\sigma}_z |0\rangle = -|0\rangle; \hat{\sigma}_z |1\rangle = +|1\rangle]$

$$\left|\psi'(t)\right\rangle = c_0\left(0\right)\exp\left[i\frac{\Theta_z}{2}t\right]\left|0\right\rangle + c_1\left(0\right)\exp\left[-i\frac{\Theta_z}{2}t\right]\left|1\right\rangle$$

which can be also put in the form

$$\left|\psi'(t)\right\rangle = \exp\left[i\frac{\Theta_{z}(t)}{2}t\right]\left\{c_{0}\left(t_{0}\right)\left|0\right\rangle + c_{1}\left(t_{0}\right)\exp\left[-i\Theta_{z}t\right]\left|1\right\rangle\right\}$$

$$\begin{split} |\psi'(t)\rangle &= \underbrace{\exp\left[i\frac{\Theta_{z}(t)}{2}t\right]c_{0}\left(t_{0}\right)}_{c_{0}'(t)}|0\rangle + \underbrace{\exp\left[i\frac{\Theta_{z}(t)}{2}t\right]\exp\left[-i\Theta_{z}t\right]c_{1}\left(t_{0}\right)}_{c_{1}'(t)}|1\rangle \\ &\left\{ \begin{aligned} c_{0}'\left(t\right) &= \exp\left[i\frac{\Theta_{z}(t)}{2}t\right]c_{0}\left(t_{0}\right) \\ c_{1}'\left(t\right) &= \exp\left[i\frac{\Theta_{z}(t)}{2}\right]\exp\left[-i\Theta_{z}(t)\right]c_{1}\left(t_{0}\right) \end{aligned} \right. \end{split}$$

which can be put in a matrix form

$$\mathbf{c}'(t) = -\exp\left[i\frac{\Theta_{\mathbf{z}}}{2}t\right] \mathbf{Z}_{\Theta_{\mathbf{z}}}(t) \mathbf{c}'(0)$$

where $\mathbf{Z}_{\Theta_{z}(t)} = \begin{vmatrix} -1 & 0\\ 0 & -e^{-i\Theta_{z}(t)} \end{vmatrix}$ with $\Theta_{z}(t) = \int_{0}^{t} \Delta\omega(\tau)d\tau$

$$\mathbf{c}'(t) = -\exp\left[i\frac{\Theta_{\mathbf{z}}}{2}t\right] \mathbf{Z}_{\Theta_{\mathbf{z}}}(t) \mathbf{c}'(0)$$

where $\mathbf{Z}_{\Theta_{z}(t)} = \begin{vmatrix} -1 & 0\\ 0 & -e^{-i\Theta_{z}(t)} \end{vmatrix}$ with $\Theta_{z}(t) = \int_{0}^{t} \Delta\omega(\tau)d\tau$

- the term $\frac{\Delta \omega_d}{2} \hat{\sigma}_z$ in the Hamiltonian enables a rotation around the \hat{z} -axis of the Bloch sphere through the control of the qubit transition frequency $\omega_q(t)$.
- To implement a π -pulse on the z axis, one has to choose the parameters such that $\Theta_z(t) = \pi$:

$$\mathbf{Z}_{\pi} = \begin{vmatrix} -1 & 0 \\ 0 & 1 \end{vmatrix}$$

Let us assume that we now apply a pulse at the qubit frequency $\omega_d = \omega_t$, so that $\Delta \omega = 0$, we have:

$$\begin{cases} i\frac{d\left|\psi'\right\rangle}{dt} = -s(t)\frac{\Omega}{2}\left(Q\hat{\sigma}_{x} + I\hat{\sigma}_{y}\right)\left|\psi'\right\rangle\\ \left|\psi'\left(t_{0}\right)\right\rangle = \left|\psi_{0}\right\rangle \end{cases}$$

- an *in-phase* pulse ($\gamma = 0$, *I*-component) corresponds to rotations around the *x*-axis
- an *out-of-phase* pulse ($\gamma = \pi/2$, Q-component) corresponds to rotations about the y-axis

$$\begin{cases} Q = 1\\ I = 0 \end{cases}$$
$$j(t) = J_m s(t) \cos(\omega_d t)$$

X-control

$$i\frac{d|\psi'\rangle}{dt} = -s(t)\frac{\Omega}{2}\hat{\sigma}_x |\psi'\rangle$$

$$|\psi'(t_0)\rangle = |\psi_0\rangle = c_0(0)|0\rangle + c_1(0)|1\rangle$$

X-control $d |\psi'\rangle$ (1)

$$i\frac{d|\psi\rangle}{dt} = -s(t)\frac{d^2}{2}\hat{\sigma}_x |\psi'\rangle$$
$$|\psi'(t_0)\rangle = |\psi_0\rangle = c_0(0)|0\rangle + c_1(0)|1\rangle$$

 \cap

$$|\psi'(t)
angle = \exp\left[irac{\Theta_x}{2}\hat{\sigma}_x
ight]|\psi_0
angle$$

 $\Theta_x(t) = \Omega\int_{t_0}^t s(\tau)d au$

- Θ_x(t) is the angle by which a state is rotated given the coupling frequency Ω, and the waveform envelope, s(t).
- To implement a π -pulse on the x axis, one has to choose the parameters such that $\Theta_x(t) = \pi$ with a driving signal in quadrature with the qubit drive.

$$|\psi'(t)\rangle = \exp\left[i\frac{\Theta_x}{2}\hat{\sigma}_x\right]|\psi_0\rangle \qquad \Theta_x(t) = Q\Omega\int_{t_0}^t s(\tau)d\tau$$

The initial state:
$$|\psi_0\rangle = c_0(t_0) |0\rangle + c_1(t_0) |1\rangle$$

 $|\psi'(t)\rangle = \left[\cos\left(\frac{\Theta_x}{2}\right)\hat{I} + i\sin\left(\frac{\Theta_x}{2}\right)\hat{\sigma}_x\right] [c_0(0)|0\rangle + c_1(0)|1\rangle]$

$$|\psi'(t)\rangle = \exp\left[i\frac{\Theta_x}{2}\hat{\sigma}_x\right]|\psi_0\rangle \qquad \Theta_x(t) = Q\Omega\int_{t_0}^t s(\tau)d\tau$$

The initial state:
$$|\psi_0\rangle = c_0(t_0) |0\rangle + c_1(t_0) |1\rangle$$

 $|\psi'(t)\rangle = \left[\cos\left(\frac{\Theta_x}{2}\right)\hat{I} + i\sin\left(\frac{\Theta_x}{2}\right)\hat{\sigma}_x\right] [c_0(0)|0\rangle + c_1(0)|1\rangle]$

Thus by exploiting the definition of the $\hat{\sigma}_z$ operator $[\hat{\sigma}_x |0\rangle = |1\rangle; \hat{\sigma}_x |1\rangle = +|0\rangle$]

$$\left|\psi'(t)\right\rangle = \cos\left(\frac{\Theta_x}{2}\right)\left[c_0(0)|0\rangle + c_1(0)|1\rangle\right] + i\sin\left(\frac{\Theta_x}{2}\right)\left[c_0(0)|1\rangle + c_1(0)|0\rangle\right]$$

$$|\psi'(t)\rangle = \exp\left[i\frac{\Theta_x}{2}\hat{\sigma}_x\right]|\psi_0\rangle \qquad \Theta_x(t) = Q\Omega\int_{t_0}^t s(\tau)d\tau$$

The initial state:
$$|\psi_0\rangle = c_0(t_0) |0\rangle + c_1(t_0) |1\rangle$$

 $|\psi'(t)\rangle = \left[\cos\left(\frac{\Theta_x}{2}\right)\hat{I} + i\sin\left(\frac{\Theta_x}{2}\right)\hat{\sigma}_x\right] [c_0(0)|0\rangle + c_1(0)|1\rangle]$

Thus by exploiting the definition of the $\hat{\sigma}_z$ operator $[\hat{\sigma}_x |0\rangle = |1\rangle; \hat{\sigma}_x |1\rangle = +|0\rangle]$

$$\left|\psi'(t)\right\rangle = \cos\left(\frac{\Theta_x}{2}\right)\left[c_0(0)|0\rangle + c_1(0)|1\rangle\right] + i\sin\left(\frac{\Theta_x}{2}\right)\left[c_0(0)|1\rangle + c_1(0)|0\rangle\right]$$

$$|\psi'(t)\rangle = \underbrace{\left[\cos\left(\frac{\Theta_x}{2}\right)c_0(0) + i\sin\left(\frac{\Theta_x}{2}\right)c_1(0)\right]}_{c_0(t)}|0\rangle + \underbrace{\left[i\sin\left(\frac{\Theta_x}{2}\right)c_0(0) + \cos\left(\frac{\Theta_x}{2}\right)c_1(0)\right]}_{c_1}|0\rangle$$

$$|\psi'(t)\rangle = \underbrace{\left[\cos\left(\frac{\Theta_x}{2}\right)c_0(0) + i\sin\left(\frac{\Theta_x}{2}\right)c_1(0)\right]}_{c_0(t)}|0\rangle + \underbrace{\left[i\sin\left(\frac{\Theta_x}{2}\right)c_0(0) + \cos\left(\frac{\Theta_x}{2}\right)c_1(0)\right]}_{c_1}|0\rangle$$

Tensor product between vector spaces

- Let V and U be two linear vector spaces, of dimension N_V and N_U respectively
- Let $\{ |v_1\rangle, |v_2\rangle, \ldots \}$ be the basis of V
- Let $\{|u_1\rangle, |u_2\rangle, \ldots\}$ be the basis of V and U, respectively.
- Vectors and operators of these spaces are denoted with an index, (v) or (u), depending on whether they belong to V or U.

Tensor product between vector spaces

- Let V and U be two linear vector spaces, of dimension N_V and N_U respectively
- Let $\{\ket{v_1}, \ket{v_2}, \ldots\}$ be the basis of V
- Let $\{|u_1\rangle, |u_2\rangle, \ldots\}$ be the basis of V and U, respectively.
- Vectors and operators of these spaces are denoted with an index, (v) or (u), depending on whether they belong to V or U.

By definition, the vector space W is called the **tensor product** of V and U

$$W = V \otimes U$$

Tensor product between vector spaces

- the set of vectors $\{|v_m\rangle \otimes |u_n\rangle$, $m = 1, 2, ...; n = 1, 2, ...\}$ constitutes a basis for W;
- the tensor product is **distributive**

$$\begin{split} & [\lambda|\varphi(v)\rangle] \otimes [|\chi(u)\rangle] = \lambda[|\varphi(v)\rangle \otimes |\chi(u)\rangle] \\ & [|\varphi(v)\rangle] \otimes [\mu|\chi(u)\rangle] = \mu[|\varphi(v)\rangle \otimes |\chi(u)\rangle] \end{split}$$

• the tensor product is **linear**

 $\begin{aligned} |\varphi(v)\rangle \otimes [\lambda_1 |\chi_1(u)\rangle + \lambda_2 |\chi_2(u)\rangle] &= \lambda_1 |\varphi(v)\rangle \otimes |\chi_1(u)\rangle + \lambda_2 |\varphi(v)\rangle \otimes |\chi_2(u)\rangle \\ [\lambda_1 |\varphi_1(v)\rangle + \lambda_2 |\varphi_2(v)\rangle] \otimes [|\chi(u)\rangle] &= \lambda_1 |\varphi_1(v)\rangle \otimes |\chi(u)\rangle + \lambda_2 |\varphi_2(v)\rangle \otimes |\chi(u)\rangle \end{aligned}$

• The scalar products in V and U permits us to define a scalar product in W as well. Let be

$$\begin{split} |\varphi(v),\chi(u)\rangle &\equiv |\varphi(v)\rangle \otimes |\chi(u)\rangle \quad \text{and} \quad \left|\varphi'(v),\chi'(u)\right\rangle \equiv \left|\varphi'(v)\right\rangle \otimes \left|\chi'(u)\right\rangle.\\ \text{Then } \left\langle\varphi'(v),\chi'(u)\mid\varphi(v),\chi(u)\right\rangle &= \left\langle\varphi'(v)\mid\varphi(v)\right\rangle \left\langle\chi'(u)\mid\chi(u)\right\rangle \end{split}$$

Tensor product of operators

- We consider a linear operator $\mathcal{A}(v)$ defined in V.
- We introduce $\tilde{\mathcal{A}}(v)$ acting in W, which we call the extension of $\mathcal{A}(v)$ in W, defined in the following way:

 $\tilde{\mathcal{A}}(v)[|\varphi(v)\rangle \otimes |\chi(u)\rangle] = [\mathcal{A}(v)|\varphi(v)\rangle] \otimes |\chi(u)\rangle$

- We consider a linear operator $\mathcal{A}(v)$ defined in V.
- We introduce $\tilde{\mathcal{A}}(v)$ acting in W, which we call the extension of $\mathcal{A}(v)$ in W, defined in the following way:

$$\tilde{\mathcal{A}}(v)[|\varphi(v)\rangle \otimes |\chi(u)\rangle] = [\mathcal{A}(v)|\varphi(v)\rangle] \otimes |\chi(u)\rangle$$

- Now let $\mathcal{A}(v)$ and $\mathcal{B}(u)$ be two linear operators acting respectively in V and U.
- Their tensor product $\mathcal{A}(v) \otimes \mathcal{B}(u)$ is the linear operator in W, such as

 $[\mathcal{A}(v)\otimes\mathcal{B}(u)][|\varphi(v)\rangle\otimes|\chi(u)\rangle]=[\mathcal{A}(v)|\varphi(v)\rangle]\otimes[\mathcal{B}(u)|\chi(u)\rangle]$

State space of two qubits

For $C_q \to 0$ the two qubits decouple

State space of two qubits

State space of two qbits

A basis for the state space $S = S^{(1)} \otimes S^{(2)}$ is given by the set of orthonormal kets

- $\left|00\right\rangle = \left|0^{(1)}\right\rangle \otimes \left|0^{(2)}\right\rangle;$
- $\left|01\right\rangle = \left|0^{(1)}\right\rangle \otimes \left|1^{(2)}\right\rangle$
- $\left|10\right\rangle = \left|1^{(1)}\right\rangle \otimes \left|0^{(2)}\right\rangle$
- $\left|11\right\rangle = \left|1^{(1)}\right\rangle \otimes \left|1^{(2)}\right\rangle$

State space of two qbits

A basis for the state space $S = S^{(1)} \otimes S^{(2)}$ is given by the set of orthonormal kets

 $|\psi(t)\rangle = c_{00}(t)|00\rangle + c_{01}(t)|01\rangle + c_{10}(t)|10\rangle + c_{11}(t)|11\rangle$

$$1 = |c_{00}|^2 + |c_{01}|^2 + |c_{10}|^2 + |c_{11}|^2$$

At t = 0 the state of the quantum circuit is $\psi_0 = |\psi(0)\rangle$

$$|\psi(0)\rangle = c_{00}(t)|00\rangle + c_{01}(0)|01\rangle + c_{10}(t)|10\rangle + c_{11}(0)|11\rangle$$

To find the state of the circuit $|\psi(t)\rangle$ at time t, we have to solve the Schrödinger equation

$$\begin{cases} i\hbar \frac{d}{dt} |\psi\rangle = \hat{H} |\psi\rangle \\ |\psi(0)\rangle = |\psi_0\rangle \end{cases}$$
$$\hat{H} = +\frac{\hbar\omega_t}{2} \hat{\sigma}_z^{(1)} \otimes \hat{I}^{(2)} + \hat{I}^{(1)} \otimes \frac{\hbar\omega_t}{2} \hat{\sigma}_z^{(2)} + \hbar\Omega_{int} \hat{\sigma}_x^{(1)} \otimes \hat{\sigma}_x^{(2)} \end{cases}$$

• We solve the problem in a new variable $|\psi'\rangle$.

Variable transformation: rotating frame

- We solve the problem in a new variable $|\psi'\rangle$.
- At time t, the Bloch sphere representation of each qubit is rotated clockwise about the z-axis by an angle $\alpha(t) = +\omega_t t$ with respect to the Bloch sphere representation of $|\psi\rangle$

$$\widehat{R}_{z}^{(h)}(\alpha(t)) = -e^{i\alpha/2}\mathbf{Z}_{\alpha}^{(h)} = \exp\left(-i\alpha(t)\frac{\widehat{\sigma}_{z}^{(h)}}{2}\right)$$

$$\alpha(t) = -\omega_t t \qquad h \in \{1, 2\}$$

Variable transformation: rotating frame

- We solve the problem in a new variable $|\psi'\rangle$.
- At time t, the Bloch sphere representation of each qubit is rotated clockwise about the z-axis by an angle $\alpha(t) = +\omega_t t$ with respect to the Bloch sphere representation of $|\psi\rangle$

$$\widehat{R}_{z}^{(h)}(\alpha(t)) = -e^{i\alpha/2} \mathbf{Z}_{\alpha}^{(h)} = \exp\left(-i\alpha(t)\frac{\widehat{\sigma}_{z}^{(h)}}{2}\right) \qquad \qquad \alpha(t) = -\omega_{t}t \qquad h \in \{1,2\}$$

$$\hat{R}(t) = \hat{R}_{z}^{(1)}(\alpha(t)) \otimes \hat{R}_{z}^{(2)}(\alpha(t)) = \exp\left[i\omega_{t}\left(t-t_{0}\right)\hat{\sigma}_{z}^{(1)}/2\right] \otimes \exp\left[i\omega_{t}\left(t-t_{0}\right)\hat{\sigma}_{z}^{(2)}/2\right]$$

Coupled Qubits in the Rotating Wave Approximation

• To find the state of the circuit $|\psi(t)\rangle$ at time t, we have to solve the Schrödinger equation

$$\begin{cases} i\hbar \frac{d}{dt} |\psi'\rangle = \hat{H}'_{int} |\psi\rangle \\ |\psi'(0)\rangle = |\psi_0\rangle \end{cases}$$

$$\hat{H}' = \hbar\Omega_{int} \left[\sigma_{-}^{(1)} \otimes \sigma_{+}^{(2)} + \sigma_{+}^{(1)} \otimes \sigma_{-}^{(2)} + \sigma_{-}^{(1)} \otimes \sigma_{-}^{(2)} e^{-i2\omega_{t}t} + \sigma_{+}^{(1)} \otimes \sigma_{+}^{(2)} e^{+i2\omega_{t}t} \right]$$

Coupled Qubits in the Rotating Wave Approximation

• To find the state of the circuit $|\psi(t)\rangle$ at time t, we have to solve the Schrödinger equation

$$\begin{cases} i\hbar \frac{d}{dt} |\psi'\rangle = \hat{H}'_{int} |\psi\rangle \\ |\psi'(0)\rangle = |\psi_0\rangle \end{cases}$$

$$\hat{H}' = \hbar\Omega_{int} \left[\sigma_{-}^{(1)} \otimes \sigma_{+}^{(2)} + \sigma_{+}^{(1)} \otimes \sigma_{-}^{(2)} + \sigma_{-}^{(1)} \otimes \sigma_{-}^{(2)} e^{-i2\omega_{t}t} + \sigma_{+}^{(1)} \otimes \sigma_{+}^{(2)} e^{+i2\omega_{t}t} \right]$$

Disregarding the oscillatin terms at frequency $2\omega_t$ we obtain (rotating wave approximation):

$$\hat{H}' = \hbar\Omega_{int} \left[\sigma_{-}^{(1)} \otimes \sigma_{+}^{(2)} + \sigma_{+}^{(1)} \otimes \sigma_{-}^{(2)} + \underline{\sigma_{-}^{(1)} \otimes \sigma_{-}^{(2)} e^{-i2\omega_t t}} + \underline{\sigma_{+}^{(1)} \otimes \sigma_{+}^{(2)} e^{+i2\omega_t t}} \right]$$

Rotating Wave Approximation

$$\begin{cases} i\hbar \frac{d}{dt} |\psi'\rangle \cong \hbar\Omega_{\text{int}} \left(\sigma_{-}^{(1)} \otimes \sigma_{+}^{(2)} + \sigma_{+}^{(1)} \otimes \sigma_{-}^{(2)}\right) |\psi'\rangle \\ |\psi'(t_0)\rangle = |\psi_0\rangle \end{cases}$$

• We expand the unknown state $|\psi'(t)\rangle$ in terms of the four basis states of S:

$$|\psi'(t)\rangle = c_{00}(t)|00\rangle + c_{01}(t)|01\rangle + c_{10}(t)|10\rangle + c_{11}(t)|11\rangle$$

• Our goal is to determine the 4 coefficients, which are function of time and subjected to the normalization condition.

Rotating Wave Approximation

$$\begin{cases} i\hbar \frac{d}{dt} |\psi'\rangle \cong \hbar\Omega_{\text{int}} \left(\sigma_{-}^{(1)} \otimes \sigma_{+}^{(2)} + \sigma_{+}^{(1)} \otimes \sigma_{-}^{(2)}\right) |\psi'\rangle \\ |\psi'(t_0)\rangle = |\psi_0\rangle \end{cases}$$

• We expand the unknown state $|\psi'(t)\rangle$ in terms of the four basis states of S:

$$|\psi'(t)\rangle = c_{00}(t)|00\rangle + c_{01}(t)|01\rangle + c_{10}(t)|10\rangle + c_{11}(t)|11\rangle$$

- Our goal is to determine the 4 coefficients, which are function of time and subjected to the normalization condition.
- We substitute this expansion in the Schrödinger equation

Rotating Wave Approximation

$$\begin{cases} i\hbar \frac{d}{dt} |\psi'\rangle \cong \hbar\Omega_{\text{int}} \left(\sigma_{-}^{(1)} \otimes \sigma_{+}^{(2)} + \sigma_{+}^{(1)} \otimes \sigma_{-}^{(2)}\right) |\psi'\rangle \\ |\psi'(t_0)\rangle = |\psi_0\rangle \end{cases}$$

• We expand the unknown state $|\psi'(t)\rangle$ in terms of the four basis states of S:

$$|\psi'(t)\rangle = c_{00}(t)|00\rangle + c_{01}(t)|01\rangle + c_{10}(t)|10\rangle + c_{11}(t)|11\rangle$$

- Our goal is to determine the 4 coefficients, which are function of time and subjected to the normalization condition.
- We substitute this expansion in the Schrödinger equation
- The operators $\sigma_+^{(1)} \otimes \sigma_-^{(2)}$ and $\sigma_-^{(1)} \otimes \sigma_+^{(2)}$ will q-bitwise act on the four basis states accordingly to the definition of $\sigma_{\pm}^{(1)}$ and $\sigma_{\pm}^{(2)}$

Coordinate evolution

• We project the resulting equation along each of the four basis states of \mathbb{S} , obtaining:

$$\begin{cases} \dot{c}_{00}(t) = 0 \\ \dot{c}_{01}(t) = -i\Omega_{int} c_{10}(t) \\ \dot{c}_{10}(t) = -i\Omega_{int} c_{01}(t) \\ \dot{c}_{11}(t) = 0 \end{cases} \begin{cases} \dot{c}_{00}(t) = \text{const} \\ \ddot{c}_{01}(t) = -\Omega_{int}^2 c_{01}(t) \\ c_{10}(t) = i/\Omega_{int} \dot{c}_{01}(t) \\ \dot{c}_{11}(t) = \text{const} \end{cases} \begin{cases} \dot{c}_{00}(t) = \text{const} \\ c_{01}(t) = -K_+ e^{+i\Omega_{int}t} + K_- e^{-i\Omega_{int}t} \\ c_{10}(t) = -K_+ e^{+i\Omega_{int}t} + K_- e^{-i\Omega_{int}t} \\ \dot{c}_{11}(t) = \text{const} \end{cases}$$

• We enforce initial conditions at initial time.

$$\begin{cases} c_{00}(t=0) = c_{00}(0), \\ c_{01}(t=0) = c_{01}(0), \\ c_{10}(t=0) = c_{10}(0), \\ c_{11}(t=0) = c_{11}(0), \end{cases} \begin{cases} \dot{c}_{00}(t) = c_{00}(0) \\ c_{01}(0) = +K_{+} + K_{-} \\ c_{10}(0) = -K_{+} + K_{-} \\ \dot{c}_{11}(t) = c_{00}(0) \end{cases} \begin{cases} 2K_{-} = c_{01}(0) + c_{10}(0) \\ 2K_{+} = c_{01}(0) - c_{10}(0) \\ c_{10}(0) = -K_{+} + K_{-} \\ \dot{c}_{11}(t) = c_{00}(0) \end{cases}$$

 $|\psi'(0)\rangle = c_{00}(0)|00\rangle + c_{01}(0)|01\rangle + c_{10}(0)|10\rangle + c_{11}(0)|11\rangle$

after a time t their state (in the rotating frame) is:

 $|\psi'(t)\rangle = c_{00}(t)|00\rangle + c_{01}(t)|01\rangle + c_{10}(t)|10\rangle + c_{11}(t)|11\rangle$

where the coefficients are the following time-functions

$$\begin{cases} c_{00}(t) = c_{00}(0) \\ c_{01}(t) = c_{01}(0) \cos(\Omega_{int}t) - ic_{10}(0) \sin(\Omega_{int}t) \\ c_{10}(t) = -ic_{01}(0) \sin(\Omega_{int}t) + c_{10}(0) \cos(\Omega_{int}t) \\ c_{11}(t) = c_{11}(0) \end{cases}$$

The coefficient can be also represented in a matrix form as:

$$\mathbf{c}(t) = \begin{vmatrix} c_{00}(t) \\ c_{01}(t) \\ c_{10}(t) \\ c_{11}(t) \end{vmatrix} \quad \mathbf{c}(t) = \mathbf{U}(t)\mathbf{c}(0) \qquad \mathbf{U}(t) = \begin{vmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos\left(\Omega_{int}t\right) & -i\sin\left(\Omega_{int}t\right) & 0 \\ 0 & -i\sin\left(\Omega_{int}t\right) & \cos\left(\Omega_{int}t\right) & 0 \\ 0 & 0 & 0 & 1 \end{vmatrix}$$

The coefficient can be also represented in a matrix form as:

$$\mathbf{c}(t) = \begin{vmatrix} c_{00}(t) \\ c_{01}(t) \\ c_{10}(t) \\ c_{11}(t) \end{vmatrix} \quad \mathbf{c}(t) = \mathbf{U}(t)\mathbf{c}(0) \qquad \mathbf{U}(t) = \begin{vmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos(\Omega_{int}t) & -i\sin(\Omega_{int}t) & 0 \\ 0 & -i\sin(\Omega_{int}t) & \cos(\Omega_{int}t) & 0 \\ 0 & 0 & 0 & 1 \end{vmatrix}$$

The two qubits are tuned in resonance, $\omega_t^{(1)} = \omega_t^{(2)}$ for a time interval Δt such that $\Omega_{int}\Delta t = \frac{\pi}{2}$,

$$\mathbf{iSWAP} = \begin{vmatrix} 1 & 0 & 0 & 0 \\ 0 & 0 & -i & 0 \\ 0 & -i & 0 & 0 \\ 0 & 0 & 0 & 1 \end{vmatrix}$$

$$\mathbf{Y}_{\Theta} = -i \begin{vmatrix} \cos\left(\frac{\Theta_y}{2}\right) & \sin\left(\frac{\Theta_y}{2}\right) \\ -\sin\left(\frac{\Theta_y}{2}\right) & \cos\left(\frac{\Theta_y}{2}\right) \end{vmatrix}$$

$$\mathbf{Y}_{\pi/2} = -\frac{i}{\sqrt{2}} \begin{vmatrix} 1 & 1 \\ -1 & 1 \end{vmatrix}$$
